The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of projectin secretion), central mervous regulatory mechanism, and panceatic function regulatory mechanism. The antibody-based immunosassay can also be applied in clarifying the physiological functions of the ligand and its derivative sequences AAV49290-302 represent peptide fragments of the 1992 ligand.
ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancrestic function modulator. This ligand could have specific applications as a
                                                                                                                                                                    WPI; 1997-363672/33,

The present sequence represents a human type ligand fragment. is used in the course of the invention. The apecification descan agent for modulating prolactin secretion which comprises a ligand polypeptide or a sait, for a 6 protein-coupled receptor

prolactin

receptor (GPCR) describes Claim syndrome,

                       This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its sait for the G protein-coupied receptor protein, It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g., weak pains and atonic bieeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and plg. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treating or preventing hypocvarianism, gonecyst cacogenesis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammai and as an aphrodisia: The agents for inhibiting prolactin secretion can be used for treating or preventing pitulitary adenomatosis, brain tumour, emmenlopathy, autoimmune disease, prolactinoma, infertility, impotence, amenorrhea, galactorrhea, acromegaly, Chiari-Frommei syndrome, amenorrhea, galactorrhea, erorbes-Albright syndrome, lymphoma, Sheehan syndrome or dyszoospermia. The inhibitory agents can also be used as contraceptives, The agents for modulating placental function can be used for treating or preventing choricoarcinoma, hydatid mole, irruption mole, abortion, unthrifty fetus, abnormal saccharometabolism, abnormal lipidmetabolism or oxytocla.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Physiologically active polypeptide recognized as ligand by G protein coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo

                 The invention provides a monocional antibody which has a specific reaction with the part peptide of the C-terminal of 1972 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunocassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences AAY49290-302 represent peptide fragments of the 1972 ligand.
                                                                                                                                                                                                                                                                                                                                                                                    Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

This can be used to control the secretion of CRH and is useful as an analysesic or for treating preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's

```
The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half infrarediction protects) and interference with particular access.

Pharmaceutical CC compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator as a particular function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic cyndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper-and polyphagia. CC hyperlipidaemia, highercholesterolaemia, hyperglyceridaemia, cc trauma, growth normone secretory disease, hyperglyceridaemia, hypercholesterolaemia, hyperglyceridaemia, schizophrenia, cc transient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, cancer pancreatitis, renal disease, cc crute myocardial infarction, infertility, spinocerebellar degeneration, cc coligogalactia, hasays can also be developed to screen compounds which are cc capable of altering the binding activity of the ligand affecting cc activation of the G protein-coupled receptor protein.

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placent uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G proteir receptor ligand. This can be used to control the secretion of CRH and is useful as an analysist or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaidosteronism, hypercortisolaemia, secondary or chronic hypodarencorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the
ligand polypeptide corresponding to amino acid residues 34 to 55 of the sequence represented in AAW31390 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function
                                                                       Claim

This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its sait for the G protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bieeding, before and after expulsion of placenta uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cov. graft and mile.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hyperlipidaemia, hyperchoiesterolaemia, hyperglyceridaemia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, furner's syndrome, neurosis, asthma, rheumatoid arthritis, spinai injury, translent brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebellar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis and/or oligogalactia, assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; oxytocin secretion promoter; G protein

                                                                                           The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating discases associated with CRH secretion such as hypersidosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 23 to 53 of the Sequence represented in ANA31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ijgand may be used as a pituitary function comodulator, a central nervous system modulator or a pancreatic function comodulator. This ligand could have specific applications as a complylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, comparations as a comparation of consciousness, anxiety syndrome, schizophrenia, comparation, provide tinama, dispercholesterolaemia, hyper-and polyphagia, comperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, cancer pancreatitis, renal disease, activation, infertility, spinocerebellar degeneration, considered pancreation, atopic dermatitis, osteoporosis and/or cancer pancreation, atopic dermatitis, osteoporosis and/or capable of altering the binding activity of the ligand affecting cancivation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW31391

                               Q
                                                                                                                                                                                     The present sequence represents a human type ligand fragment. It is used in the course of the invention. The specification describes is a spent for modulating prolactin secretion which comprises a cityand polypeptide or a salt, for a G protein-coupied receptor (GPCR) if the agents for promoting prolactin secretion can be used for citreating or preventing hypocovarianism, gonecyst cacogenesis, menopausal contraction in a domestic mammal and as an aphrodistac. The agents for citreating prolactin secretion can be used for treating or preventing thibiting prolactin secretion can be used for treating or preventing continuation, infertility, impotence, amenorabea, galactorrhea, galactorrhea, compast, infertility, impotence, amenorabea, galactorrhea, composed, contractions, the syndrome, spents for probes-Albright syndrome, tymphoma, Sheehan syndrome or dyscospermia. The inhibitory agents can also be used as contraceptives. The agents for codulating placental function can be used for treating or preventing control carcinoma, hydatid moie, irruption mole, abortion, unthrifty fetus, contraceptives.
                                                                       Matches
                                                                                         Query Match

No. 1s the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
